LIGHTED WARNING SYSTEMS

SMART WARNING MECHANISM

It is designed to be used in various areas within the factory. It can be controlled by software and easily installed.

It can be used for visual warnings in areas such as box sealing, quality control, and production workstations.

PROVIDES A QUICK SOLUTION

For example, when a breakdown occurs on the production line, the Lighted Warning Automaton immediately activates and alerts the workers.

This ensures that the breakdown is quickly resolved and the production process is not interrupted.

INTEGRATED WITH SOFTWARE

Lighted warning systems establish a visual and auditory smart warning mechanism within the factory, controlled by software.

The system can be customized according to the operational needs and provides different warnings to make the workers' tasks easier.

For example, it can be used for visual warnings in areas such as box sealing, quality control, production workstations, and dangerous zones.

IMPROVED MANAGEMENT

Smart Alert Systems support business processes by integrating with ERP modules. This way, production data is automatically collected and analyzed.

These data help business managers better manage the production process.
